## **Chapter 1**

## **About Simics Documentation**

## 1.1 Conventions

Let us take a quick look at the conventions used throughout the Simics documentation. Scripts, screen dumps and code fragments are presented in a monospace font. In screen dumps, user input is always presented in bold font, as in:

```
Welcome to the Simics prompt
simics> this is something that you should type
```

Sometimes, artificial line breaks may be introduced to prevent the text from being too wide. When such a break occurs, it is indicated by a small arrow pointing down, showing that the interrupted text continues on the next line:

```
This is an artificial alline break that shouldn't be there.
```

The directory where Simics is installed is referred to as [simics], for example when mentioning the [simics]/README file. In the same way, the shortcut [workspace] is used to point at the user's workspace directory.

## 1.2 Simics Guides and Manuals

Simics comes with several guides and manuals, which will be briefly described here. All documentation can be found in <code>[simics]/doc</code> as Windows Help files (on Windows), HTML files (on Unix) and PDF files (on both platforms). The new Eclipse-based interface also includes Simics documentation in its own help system.

#### Simics Installation Guide for Unix and for Windows

These guides describe how to install Simics and provide a short description of an installed Simics package. They also cover the additional steps needed for certain features of Simics to work (connection to real network, building new Simics modules, ...).

#### Simics User Guide for Unix and for Windows

These guides focus on getting a new user up to speed with Simics, providing information on Simics features such as debugging, profiling, networks, machine configuration and scripting.

## Simics Eclipse User Guide

This is an alternative User Guide describing Simics and its new Eclipse-based graphical user interface.

## Simics Target Guides

These guides provide more specific information on the different architectures simulated by Simics and the example machines that are provided. They explain how the machine configurations are built and how they can be changed, as well as how to install new operating systems. They also list potential limitations of the models.

## Simics Programming Guide

This guide explains how to extend Simics by creating new devices and new commands. It gives a broad overview of how to work with modules and how to develop new classes and objects that fit in the Simics environment. It is only available when the DML add-on package has been installed.

## **DML Tutorial**

This tutorial will give you a gentle and practical introduction to the Device Modeling Language (DML), guiding you through the creation of a simple device. It is only available when the DML add-on package has been installed.

#### **DML Reference Manual**

This manual provides a complete reference of DML used for developing new devices with Simics. It is only available when the DML add-on package has been installed.

#### Simics Reference Manual

This manual provides complete information on all commands, modules, classes and haps implemented by Simics as well as the functions and data types defined in the Simics API.

#### Simics Micro-Architectural Interface

This guide describes the cycle-accurate extensions of Simics (Micro-Architecture Interface or MAI) and provides information on how to write your own processor timing models. It is only available when the DML add-on package has been installed.

## **RELEASENOTES and LIMITATIONS files**

These files are located in Simics's main directory (i.e., [simics]). They list limitations, changes and improvements on a per-version basis. They are the best source of information on new functionalities and specific bug fixes.

## **Simics Technical FAQ**

This document is available on the Virtutech website at http://www.simics.net/support. It answers many questions that come up regularly on the support forums.

## **Simics Support Forum**

The Simics Support Forum is the main support tool for Simics. You can access it at http://www.simics.net.

## **Other Interesting Documents**

Simics uses Python as its main script language. A Python tutorial is available at http://www.python.org/doc/2.4/tut/tut.html. The complete Python documentation is located at http://www.python.org/doc/2.4/.

## Chapter 2

## Simics/Fiesta Overview

## 2.1 Introduction

Simics/Fiesta models the Sun Blade 1500 workstation, also called Taco, with an UltraSPARC-IIIi processor. The other workstation based on the Fiesta architecture, Sun Blade 2500 (Enchilada), is not supported in Simics. Taco supports a single processor and up to 8GB of memory. The Fiesta system is build around the Tomatillo host-to-PCI bridge, and the ALi MD1535D+ south bridge with several on-board devices, such as IDE harddisks and an AT-API CD-ROM.

Virtutech does not provide any disk images with Solaris for Fiesta, due to licensing issues. However, scripts are included for installing Solaris 8, 9 or 10 on the virtual machine. Installing Solaris is described in chapter 6.1.

## 2.2 Supported Hardware

A Taco workstation has several on-board devices on the mother board as well as five empty PCI slots. Not all devices are currently supported in Simics, a full list can be found in chapter 7, Limitations.

#### **On-board Devices**

Tomatillo Host-to-PCI bridge MD1535D+ South Bridge Two IDE controllers

Two serial ports (NS16550)

## **Supported PCI Devices**

'ce'	Gb Ethernet controller	(Cassini+)
'bge'	Gb Ethernet controller	(BCM5703C)
'bge'	Dual Gb Ethernet controller	(BCM5704C)
'hme'	Ethernet controller	(Cheerio)

'isp'	SCSI controller	(ISP1040)
'pgx64'	24-Bit Frame Buffer	(pgx64)
'qlc'	Fibre-Channel controller	(ISP2200)
	PCI-to-PCI bridge	(i21152)

A good guide to the Sun Enterprise servers and what boards and devices that are supported can be found in the "Sun System Handbook", available online at: http://sunsolve.sun.com/handbook\_pub/

#### Note:

The Simics/Fiesta model does not currently support a keyboard or mouse, and thus the pgx64 card cannot be used to create an interactive X session. It can be used as a passive display by starting an X server in no mouse and no keyboard mode.

## **Chapter 3**

## **Simulated Machines**

Simics scripts for starting Fiesta machines are located in the [workspace]/targets/fiesta/directory, while the actual configuration scripts can be found in [simics]/targets/fiesta/.

## 3.1 Chili

Chili is a Sun Blade 1500 workstation with a single UltraSPARC IIIi processor running at 96 MHz, and 256 MB of memory. It has one Ethernet adapter, one IDE disk and one IDE CD-ROM. The default configuration can be modified as described in section 3.3. An operating system must be installed on chili before it can be used.

## 3.1.1 Chili Scripts

#### chili-common.simics

Starts the Chili machine with the default configuration.

## chili-sol<version>-cd-install.simics

Script for installing Solaris on the simulated machine. <version> is one of 8, 9 and 10.

## 3.2 Salsa

Salsa is a Sun Blade 1500 workstation with a single UltraSPARC IIIi processor running at 96 MHz, and 256 MB of memory. It has one Ethernet adapter, one IDE disk and one IDE CD-ROM. The default configuration can be modified as described in section 3.3.

The Salsa machine is configured for existing Solaris 8, 9 or 10 disk dumps. The disk dumps are only available for commercial customer with a special license agreement with Sun. Some common GNU utilities are installed on the disk images, such as bash, gcc, gmake and emacs. The *SimicsFS* file-system is also included.

Additional information:

Solaris 8 (7/03) and Solaris 9 (4/04) installed as "Developer System" directly on Simics.

- SimicsFS support.
- Login root, no password.
- Configured with static IP address 10.10.0.18, gw 10.10.0.1, when DHCP not used.

## 3.2.1 Salsa Scripts

#### salsa-common.simics

Starts the Salsa machine with the default configuration.

## salsa-dhcp-common.simics

Similar to salsa-common.simics, but gets the host name and IP address from the DHCP server.

## 3.3 Parameters for Machine Scripts

The following parameters can be set before running the chili-common.simics, or salsa-common.simics scripts. Other .simics scripts may set some of the parameters unconditionally, and do not allow the user to override them. For example, the salsa-dhcp-common.simics script will always set the \$create\_network variable to yes.

## 3.3.1 chili-common and salsa-common

#### \$create\_network

Set to yes if the script should create an Ethernet link and connect the primary Ethernet adapter to it.

#### \$disk size

Size of the primary hard disk. This parameter must match any disk images that are added to the primary disk.

## \$do\_boot

Set to no to stop at OBP prompt, without booting the OS.

#### \$do\_login

Set to no to prevent the script from logging in as root automatically when the operating system has reached the login prompt.

## \$eth\_link

The Ethernet link to connect the primary Ethernet adapter to. This parameter should be set when a link already exist and the *\$create\_network* parameter is no.

#### **\$hostid**

The hostid for the simulated machine.

## \$freq\_mhz

The clock frequency in MHz for all processors.

## \$host\_name

The host name used by the DHCP and DNS servers for this machine This variable will not change the host name set for the machine on the disk dumps.

## \$ip\_address

The IP address used by the DHCP and DNS servers for this machine This variable will not change any IP address set for the machine on the disk dumps.

## \$mac\_address

MAC address of the primary Ethernet adapter.

## \$memory\_megs

The total amount of system memory, in MB.

#### \$os

The operating system to boot, one of solaris10, solaris9, and solaris8. Requires that a matching disk dump exists.

## **\$rtc\_time**

Date and time of the real-time clock at boot.

#### \$service\_node

The *service node* to use for DHCP and DNS. This parameter should be set when a service noce already exist and the *\$create\_network* parameter is no.

## **Chapter 4**

## **Supported Components**

The following sections list components that are supported for the Fiesta architecture. There also exist other components in Simics, such as various PCI devices, that may work for Fiesta but that have not been tested.

The default machines are constructed from components in the <code>-system.include</code> files in <code>[simics]/targets/fiesta/</code>. See the Configuration and Checkpointing chapter in the Simics User Guide for information on how to define your own machine, or make modifications to an existing machine.

## 4.1 Fiesta Components

## 4.1.1 taco-system

## Description

The "taco-system" component represents a Sun Blade 1500 single processor workstation mother-board with all on-board devices except the south-bridge and PCI devices.

## PCI slot mappings:

Simics slot	Tomatillo	Bus	Device id	Bus address	Note
0	31	A	2	1e,600000	
1	31	A	3	1e,600000	
2	31	A	4	1e,600000	
3	31	A	5	1e,600000	
4	31	В	2	1f,700000	bge (BCM5703C)
5	31	В	3	1f,700000	

## **Attributes**

cpu\_frequency

Required attribute; read/write access; type: Integer.

Processor frequency in MHz.

#### hostid

Required attribute; read/write access; type: Integer.

The hostid of the machine.

## mac\_address

Required attribute; read/write access; type: String.

The main MAC address is the machine.

## memory\_megs

Pseudo attribute; read-only access; type: Integer.

The amount of RAM in mega-bytes in the machine.

## rtc\_time

Required attribute; read/write access; type: String.

The date and time of the Real-Time clock.

#### Commands

## create-taco-system ["name"] cpu\_frequency hostid "mac\_address" "rtc\_time"

Creates a non-instantiated component of the class "taco-system". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## <taco-system>.get-nvram-hostid

Reads the Sun hostid from the NVRAM.

## <taco-system>.get-nvram-mac

Reads the default MAC address from the NVRAM.

## <taco-system>.get-prom-env ["variable"]

Prints an OBP variable with its value, or all variables if no argument is specified. Only variables with string, integer, boolean and enumeration types are supported.

## <taco-system>.info

Print detailed information about the configuration of the device.

## <taco-system>.set-nvram-hostid hostid

Writes the Sun hostid into the NVRAM.

#### <taco-system>.set-nvram-mac "mac"

Writes the default MAC address into the NVRAM.

## <taco-system>.set-prom-defaults

Restores all OBP variables to their default values.

## <taco-system>.set-prom-env "variable" (int|"string")

Sets the value of an OBP variable in the NVRAM. Only variables with string, integer, boolean and enumeration types are supported.

## <taco-system>.status

Print detailed information about the current status of the device.

#### **Connectors**

Name	Type	Direction
ddr-slot[0-3]	mem-bus	down
i2c	i2c-bus	down
pci-slot-ide	pci-bus	down
pci-slot-isa	pci-bus	down
pci-slot-pm	pci-bus	down
pci-slot[0-5]	pci-bus	down

## 4.1.2 south-bridge-sun-md1535d

## Description

The "south-bridge-sun-md1535d" component represents the ALi MD1535D south-bridge modified for use in a Fiesta (Taco/Enchilada) system.

#### **Commands**

## create-south-bridge-sun-md1535d ["name"]

Creates a non-instantiated component of the class "south-bridge-sun-md1535d". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## <south-bridge-sun-md1535d>.info

Print detailed information about the configuration of the device.

## <south-bridge-sun-md1535d>.status

Print detailed information about the current status of the device.

#### **Connectors**

Name	Type	Direction
i2c	i2c-bus	up
pci-bus-ide	pci-bus	up
pci-bus-isa	pci-bus	up
pci-bus-pm	pci-bus	up
com[1-3]	serial	down
ide0-master	ide-slot	down
ide0-slave	ide-slot	down
ide1-master	ide-slot	down
ide1-slave	ide-slot	down

## 4.2 PCI Device Components

## 4.2.1 sun-pci-ce

## Description

The "sun-pci-ce" component represents a PCI card with a Cassini gigabit Ethernet adapter, for use in Sun systems.

## **Attributes**

#### mac address

Required attribute; read/write access; type: String.

The MAC address of the Ethernet adapter.

#### **Commands**

## create-sun-pci-ce ["name"] "mac\_address"

Creates a non-instantiated component of the class "sun-pci-ce". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## <sun-pci-ce>.info

Print detailed information about the configuration of the device.

## <sun-pci-ce>.status

Print detailed information about the current status of the device.

#### **Connectors**

Name	Type	Direction
pci-bus	pci-bus	up
ethernet	ethernet-link	down

## 4.2.2 sun-pci-hme

## Description

The "sun-pci-hme" component represents a PCI card with a HME Ethernet adapter, for use in Sun systems.

#### **Attributes**

#### mac\_address

Required attribute; read/write access; type: String.

The MAC address of the Ethernet adapter.

## Commands

## create-sun-pci-hme ["name"] "mac\_address"

Creates a non-instantiated component of the class "sun-pci-hme". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## <sun-pci-hme>.info

Print detailed information about the configuration of the device.

## <sun-pci-hme>.status

Print detailed information about the current status of the device.

#### **Connectors**

Name	Type	Direction
pci-bus	pci-bus	up
ethernet	ethernet-link	down

## 4.2.3 sun-pci-hme-isp

## Description

The "sun-pci-hme-isp" component represents a PCI card with one HME Ethernet adapter and one ISP SCSI controller for use in Sun systems.

#### **Attributes**

## mac\_address

**Required** attribute; **read/write** access; type: **String**.

The MAC address of the Ethernet adapter.

## scsi\_id

Optional attribute; read/write access; type: Integer.

The ID on the SCSI bus.

#### **Commands**

## create-sun-pci-hme-isp ["name"] "mac\_address" [scsi\_id]

Creates a non-instantiated component of the class "sun-pci-hme-isp". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## <sun-pci-hme-isp>.info

Print detailed information about the configuration of the device.

## <sun-pci-hme-isp>.status

Print detailed information about the current status of the device.

#### **Connectors**

Name	Type	Direction
pci-bus	pci-bus	up
ethernet	ethernet-link	down
scsi-bus	scsi-bus	down

## 4.2.4 sun-pci-pgx64

#### Description

The "sun-pci-pgx64" component represents a PCI card with a PGX64 (Rage XL) graphics adapter, for use in Sun systems.

## Commands

## create-sun-pci-pgx64 ["name"]

Creates a non-instantiated component of the class "sun-pci-pgx64". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## <sun-pci-pgx64>.info

Print detailed information about the configuration of the device.

## <sun-pci-pgx64>.status

Print detailed information about the current status of the device.

#### **Connectors**

Name	Type	Direction
pci-bus	pci-bus	up
console	graphics-console	down

## 4.2.5 sun-pci-qlc

## Description

The "sun-pci-qlc" component represents a PCI card with a QLC Fibre-Channel SCSI controller for use in Sun systems.

## **Attributes**

loop\_id

Required attribute; read/write access; type: Integer.

The FC loop ID of the QLC controller.

#### **Commands**

## create-sun-pci-qlc ["name"] loop\_id

Creates a non-instantiated component of the class "sun-pci-qlc". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## <sun-pci-qlc>.info

Print detailed information about the configuration of the device.

## <sun-pci-qlc>.status

Print detailed information about the current status of the device.

#### **Connectors**

Name	Type	Direction
pci-bus	pci-bus	up
fc-loop	simple-fc-loop	down

## 4.2.6 sun-pci-qlc-qlc

## Description

The "sun-pci-qlc" component represents a PCI card with two QLC Fibre-Channel SCSI controller for use in Sun systems.

#### **Attributes**

loop\_id0

Required attribute; read/write access; type: Integer.

The FC loop ID of the first QLC controller.

loop\_id1

Required attribute; read/write access; type: Integer.

The FC loop ID of the second QLC controller.

#### Commands

## create-sun-pci-qlc ["name"] loop\_id0 loop\_id1

Creates a non-instantiated component of the class "sun-pci-qlc-qlc". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## <sun-pci-qlc-qlc>.info

Print detailed information about the configuration of the device.

## <sun-pci-qlc-qlc>.status

Print detailed information about the current status of the device.

#### **Connectors**

Name	Type	Direction
pci-bus	pci-bus	up
fc-loop[0-1]	simple-fc-loop	down

## 4.2.7 pci-bcm5703c

## Description

The "pci-bcm5703c" component represents a Broadcom 5703C PCI based gigabit Ethernet adapter.

## **Attributes**

bios

Optional attribute; read/write access; type: String.

The x86 BIOS file to use.

#### mac\_address

Required attribute; read/write access; type: String.

The MAC address of the Ethernet adapter.

#### **Commands**

## create-pci-bcm5703c ["name"] "mac\_address" ["bios"]

Creates a non-instantiated component of the class "pci-bcm5703c". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## <pci-bcm5703c>.info

Print detailed information about the configuration of the device.

## <pci-bcm5703c>.status

Print detailed information about the current status of the device.

#### **Connectors**

Name	Type	Direction
pci-bus	pci-bus	up
ethernet	ethernet-link	down

## 4.2.8 pci-bcm5704c

#### Description

The "pci-bcm5704c" component represents a Broadcom 5704C PCI based dual-port gigabit Ethernet adapter.

#### **Attributes**

#### bios

Optional attribute; read/write access; type: String.

The x86 BIOS file to use.

#### mac address0

Required attribute; read/write access; type: String.

The MAC address of the first Ethernet adapter.

## mac\_address1

Required attribute; read/write access; type: String.

The MAC address of the second Ethernet adapter.

#### **Commands**

## create-pci-bcm5704c ["name"] "mac\_address0" "mac\_address1" ["bios"]

Creates a non-instantiated component of the class "pci-bcm5704c". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## <pci-bcm5704c>.info

Print detailed information about the configuration of the device.

## <pci-bcm5704c>.status

Print detailed information about the current status of the device.

#### **Connectors**

Name	Type	Direction
pci-bus	pci-bus	up
ethernet[0-1]	ethernet-link	down

## 4.2.9 pci-sym53c875

## Description

The "pci-sym53C875" component represents a SYM53C875PCI based SCSI controller.

#### **Attributes**

bios

Optional attribute; read/write access; type: String.

The x86 SCSI BIOS file to use.

## Commands

## create-pci-sym53c875 ["name"] ["bios"]

Creates a non-instantiated component of the class "pci-sym53c875". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## <pci-sym53c875>.info

Print detailed information about the configuration of the device.

## <pci-sym53c875>.status

Print detailed information about the current status of the device.

#### **Connectors**

Name	Type	Direction
pci-bus	pci-bus	up
scsi-bus	scsi-bus	down

## 4.2.10 pci-sym53c876

## Description

The "pci-sym53C876" component represents a SYM53C876PCI based dual-port SCSI controller.

#### Commands

## create-pci-sym53c876 ["name"]

Creates a non-instantiated component of the class "pci-sym53c876". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## <pci-sym53c876>.info

Print detailed information about the configuration of the device.

## <pci-sym53c876>.status

Print detailed information about the current status of the device.

#### **Connectors**

Name	Type	Direction
pci-bus	pci-bus	up
scsi-bus[0-1]	scsi-bus	down

## 4.3 Standard Components

## 4.3.1 ddr-memory-module

## Description

The "ddr-memory-module" component represents a DDR memory module.

#### **Attributes**

#### banks

Optional attribute; read/write access; type: Integer.

Number of banks.

## cas\_latency

**Optional** attribute; **read/write** access; type: **Integer**.

CAS-latency; each set bit corresponds to a latency the memory can handle

#### columns

Optional attribute; read/write access; type: Integer.

Number of columns.

#### ecc width

**Optional** attribute; **read/write** access; type: **Integer**.

The error correction width.

## memory\_megs

Pseudo attribute; read-only access; type: Integer.

Total about of memory in MB.

## module\_data\_width

Optional attribute; read/write access; type: Integer.

The module SDRAM width.

## module\_type

Optional attribute; read/write access; type: String.

Type of memory.

## primary\_width

Optional attribute; read/write access; type: Integer.

Primary SDRAM width.

## rank\_density

**Optional** attribute; **read/write** access; type: **Integer**.

The rank density.

#### ranks

Optional attribute; read/write access; type: Integer.

Number of ranks (logical banks).

## rows

Optional attribute; read/write access; type: Integer.

Number of rows.

## speed

Optional attribute; read/write access; type: String.

PC standard speed. Supported values are PC2700 and none.

#### Commands

## create-ddr-memory-module ["name"] [rows] [columns] [ranks] [module\_data\_width] [primary\_width]

Creates a non-instantiated component of the class "ddr-memory-module". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## new-ddr-memory-module ["name"] [rows] [columns] [ranks] [module\_data\_width] [primary\_wid

Creates an instantiated component of the class "ddr-memory-module". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## <ddr-memory-module>.info

Print detailed information about the configuration of the device.

## <ddr-memory-module>.status

Print detailed information about the current status of the device.

#### **Connectors**

Name Type Direction mem-bus mem-bus up

## 4.3.2 std-ethernet-link

## Description

The "std-ethernet-link" component represents a standard Ethernet link.

## **Attributes**

## frame\_echo

Optional attribute; read/write access; type: Integer.

Set this attribute to echo frames back to the sender. Default is not to echo frames.

#### link name

Optional attribute; read/write access; type: String.

The name to use for the **ethernet-link** object. An error will be raised at instantiation time if the link cannot be given this name.

## **Commands**

## create-std-ethernet-link ["name"] ["link\_name"] [frame\_echo]

Creates a non-instantiated component of the class "std-ethernet-link". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## new-std-ethernet-link ["name"] ["link\_name"] [frame\_echo]

Creates an instantiated component of the class "std-ethernet-link". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## <std-ethernet-link>.info

Print detailed information about the configuration of the device.

#### <std-ethernet-link>.status

Print detailed information about the current status of the device.

## **Connectors**

Name Type Direction device ethernet-link any

#### 4.3.3 std-serial-link

## Description

The "std-serial-link" component represents a standard Serial link.

#### Commands

#### create-std-serial-link ["name"]

Creates a non-instantiated component of the class "std-serial-link". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## new-std-serial-link ["name"]

Creates an instantiated component of the class "std-serial-link". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

#### <std-serial-link>.info

Print detailed information about the configuration of the device.

## <std-serial-link>.status

Print detailed information about the current status of the device.

#### **Connectors**

Name Type Direction serial [0-1] serial any

## 4.3.4 std-service-node

## Description

The "std-service-node" component represents a network service node that can be connected to Ethernet links to provide services such as DNS, DHCP/BOOTP, RARP and TFTP. A service node component does not have any connectors by default. Instead, connectors have to be added using the **<std-service-node>.add-connector** command.

#### **Attributes**

## dynamic\_connectors

**Optional** attribute; **read/write** access; type: [[**iss**]\*].

List of user added connectors

## next\_connector\_id

**Optional** attribute; **read/write** access; type: **Integer**.

Next service-node device ID.

#### Commands

## create-std-service-node ["name"]

Creates a non-instantiated component of the class "std-service-node". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

#### new-std-service-node ["name"]

Creates an instantiated component of the class "std-service-node". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## <std-service-node>.add-connector "ip" ["netmask"]

Adds a connector to the service-node with specified IP address and netmask. A connector must be created for the service-node before an Ethernet link can be connected to it. The *ip* argument is the IP address that the service node will use on the link. The *netmask* argument is optional, and defaults to 255.255.25.0. The name of the new connector is returned.

## <std-service-node>.info

Print detailed information about the configuration of the device.

#### <std-service-node>.status

Print detailed information about the current status of the device.

## 4.3.5 std-ide-disk

## Description

The "std-ide-disk" component represents an IDE disk.

## **Attributes**

file

Optional attribute; read/write access; type: String.

File with disk contents for the full disk Either a raw file or a CRAFF file.

size

Required attribute; read/write access; type: Integer.

The size of the IDE disk in bytes.

## **Commands**

## create-std-ide-disk ["name"] size ["file"]

Creates a non-instantiated component of the class "std-ide-disk". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

#### <std-ide-disk>.info

Print detailed information about the configuration of the device.

## <std-ide-disk>.status

Print detailed information about the current status of the device.

#### **Connectors**

Name Type Direction ide-slot ide-slot up

#### 4.3.6 std-ide-cdrom

#### Description

The "std-ide-cdrom" component represents an IDE ATAPI CD-ROM.

#### **Commands**

## create-std-ide-cdrom ["name"]

Creates a non-instantiated component of the class "std-ide-cdrom". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

#### <std-ide-cdrom>.info

Print detailed information about the configuration of the device.

## <std-ide-cdrom>.status

Print detailed information about the current status of the device.

#### **Connectors**

Name Type Direction ide-slot ide-slot up

#### 4.3.7 std-scsi-bus

## Description

The "std-scsi-bus" component represents a 16 slot SCSI bus.

#### **Commands**

## create-std-scsi-bus ["name"]

Creates a non-instantiated component of the class "std-scsi-bus". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## <std-scsi-bus>.info

Print detailed information about the configuration of the device.

## <std-scsi-bus>.status

Print detailed information about the current status of the device.

#### **Connectors**

Name Type Direction scsi-bus scsi-bus any

## 4.3.8 std-scsi-disk

## Description

The "std-scsi-disk" component represents a SCSI-2 disk.

## **Attributes**

## file

## Optional attribute; read/write access; type: String.

File with disk contents for the full disk Either a raw file or a CRAFF file.

#### scsi id

Required attribute; read/write access; type: Integer.

The ID on the SCSI bus.

#### size

Required attribute; read/write access; type: Integer.

The size of the SCSI disk in bytes.

#### **Commands**

## create-std-scsi-disk ["name"] scsi\_id size ["file"]

Creates a non-instantiated component of the class "std-scsi-disk". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## <std-scsi-disk>.info

Print detailed information about the configuration of the device.

#### <std-scsi-disk>.status

Print detailed information about the current status of the device.

#### **Connectors**

Name Type Direction scsi-bus scsi-bus up

## 4.3.9 std-scsi-cdrom

## Description

The "std-scsi-cdrom" component represents a SCSI-2 CD-ROM.

#### **Attributes**

scsi\_id

Required attribute; read/write access; type: Integer.

The ID on the SCSI bus.

#### Commands

## create-std-scsi-cdrom ["name"] scsi\_id

Creates a non-instantiated component of the class "std-scsi-cdrom". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## <std-scsi-cdrom>.info

Print detailed information about the configuration of the device.

#### <std-scsi-cdrom>.status

Print detailed information about the current status of the device.

#### **Connectors**

Name Type Direction scsi-bus scsi-bus up

## 4.3.10 simple-fc-disk

## Description

The "simple-fc-disk" component represents a SCSI-2 disk for use with Fibre-Channel SCSI controllers using the simplified FC protocol in Simics.

#### **Attributes**

## file

Optional attribute; read/write access; type: String.

File with disk contents for the full disk Either a raw file or a CRAFF file.

## loop\_id

Required attribute; read/write access; type: Integer.

The loop ID for the FC disk.

#### node name

Required attribute; read/write access; type: Integer.

The node name for the FC disk.

## port\_name

Required attribute; read/write access; type: Integer.

The port name for the FC disk.

#### size

Required attribute; read/write access; type: Integer.

The size of the FC disk in bytes.

#### **Commands**

## create-simple-fc-disk ["name"] size ["file"] loop\_id node\_name port\_name

Creates a non-instantiated component of the class "simple-fc-disk". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## <simple-fc-disk>.info

Print detailed information about the configuration of the device.

## <simple-fc-disk>.status

Print detailed information about the current status of the device.

#### **Connectors**

Name Type Direction fc-loop simple-fc-loop up

#### 4.3.11 std-text-console

## Description

The "std-text-console" component represents a serial text console.

#### **Attributes**

#### bg\_color

Optional attribute; read/write access; type: String.

The background color.

## fg\_color

Optional attribute; read/write access; type: String.

The foreground color.

## height

Optional attribute; read/write access; type: Integer.

The height of the console window.

## title

Optional attribute; read/write access; type: String.

The Window title.

## width

Optional attribute; read/write access; type: Integer.

The width of the console window.

## win32\_font

Optional attribute; read/write access; type: String.

Font to use in the console on Windows host.

## $x11\_font$

Optional attribute; read/write access; type: String.

Font to use in the console when using X11 (Linux/Solaris host).

#### **Commands**

## create-std-text-console ["name"] ["title"] ["bg\_color"] ["fg\_color"] ["x11\_font"] ["win32\_font"] [u

Creates a non-instantiated component of the class "std-text-console". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## new-std-text-console ["name"] ["title"] ["bg\_color"] ["fg\_color"] ["x11\_font"] ["win32\_font"] [win32\_font"] [win32\_font"] [win32\_font"]

Creates an instantiated component of the class "std-text-console". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

#### <std-text-console>.info

Print detailed information about the configuration of the device.

## <std-text-console>.status

Print detailed information about the current status of the device.

#### **Connectors**

**Name Type Direction** serial serial up

## 4.3.12 std-server-console

#### Description

The "std-server-console" component represents a serial console accessible from the host using telnet.

#### **Attributes**

#### telnet\_port

Required attribute; read/write access; type: Integer.

TCP/IP port to connect the telnet service of the console to.

#### **Commands**

## create-std-server-console ["name"] telnet\_port

Creates a non-instantiated component of the class "std-server-console". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## new-std-server-console ["name"] telnet\_port

Creates an instantiated component of the class "std-server-console". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

#### <std-server-console>.info

Print detailed information about the configuration of the device.

#### <std-server-console>.status

Print detailed information about the current status of the device.

## **Connectors**

**Name Type Direction** serial serial up

## 4.3.13 std-graphics-console

#### Description

The "std-graphics-console" component represents a graphical console for displaying output from a simulated graphics adapters and getting input for mouse and keyboard devices.

## **Attributes**

#### window

Optional attribute; read/write access; type: b.

Try to open window if TRUE (default). FALSE disabled the window.

#### **Commands**

## create-std-graphics-console ["name"] [window]

Creates a non-instantiated component of the class "std-graphics-console". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## new-std-graphics-console ["name"] [window]

Creates an instantiated component of the class "std-graphics-console". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## <std-graphics-console>.info

Print detailed information about the configuration of the device.

## <std-graphics-console>.status

Print detailed information about the current status of the device.

#### **Connectors**

Name	Type	Direction
device	graphics-console	up
keyboard	keyboard	up
mouse	mouse	up

## 4.3.14 std-text-graphics-console

## Description

The "std-text-graphics-console" component represents a text console for use with VGA instead of a graphics console.

#### **Commands**

## create-std-text-graphics-console ["name"]

Creates a non-instantiated component of the class "std-text-graphics-console". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

#### new-std-text-graphics-console ["name"]

Creates an instantiated component of the class "std-text-graphics-console". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## <std-text-graphics-console>.info

Print detailed information about the configuration of the device.

## <std-text-graphics-console>.status

Print detailed information about the current status of the device.

#### **Connectors**

Name	Type	Direction
device	graphics-console	up
keyboard	keyboard	up

## 4.4 Timing Components

## 4.4.1 sample-gcache

## Description

A pre-configured combined L1 instruction and data cache

#### Commands

## create-sample-gcache ["name"]

Creates a non-instantiated component of the class "sample-gcache". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## new-sample-gcache ["name"]

Creates an instantiated component of the class "sample-gcache". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

## <sample-gcache>.info

Print detailed information about the configuration of the device.

## <sample-gcache>.status

Print detailed information about the current status of the device.

## **Connectors**

Name	Type	Direction
cpu-space	timing-model	up

#### 4.4.2 sample-ma-model

#### Description

A sample SPARC MAI model with a simple cache

#### **Commands**

### create-sample-ma-model ["name"]

Creates a non-instantiated component of the class "sample-ma-model". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

#### new-sample-ma-model ["name"]

Creates an instantiated component of the class "sample-ma-model". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

#### <sample-ma-model>.info

Print detailed information about the configuration of the device.

#### <sample-ma-model>.status

Print detailed information about the current status of the device.

#### **Connectors**

Name Type Direction cpu-space timing-model up

#### 4.4.3 sample-ooo-model

### Description

A sample SPARC MAI model based on **ooo\_micro\_arch** and a simple cache.

#### **Commands**

### create-sample-ooo-model ["name"]

Creates a non-instantiated component of the class "sample-ooo-model". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

#### new-sample-ooo-model ["name"]

Creates an instantiated component of the class "sample-ooo-model". If *name* is not specified, the component will get a class-specific default name. The other arguments correspond to class attributes.

#### <sample-ooo-model>.info

Print detailed information about the configuration of the device.

#### <sample-ooo-model>.status

Print detailed information about the current status of the device.

#### **Connectors**

Name Type Direction cpu-space timing-model up

## 4.5 Base Components

The base components are abstract classes that contain generic component attributes and commands available for all components.

### 4.5.1 component

#### Description

Base component class, should not be instantiated.

#### **Attributes**

#### connections

**Optional** attribute; **read/write** access; type: [[**sos**]\*].

List of connections for the component. The format is a list of lists, each containing the name of the connector, the connected component, and the name of the connector on the other component.

#### connectors

Pseudo class attribute; read-only access; type: D.

Dictionary of dictionaries with connectors defined by this component class, indexed by name. Each connector contains the name of the connector "type", a "direction" ("up", "down" or "any"), a flag indicating if the connector can be "empty", another flag that is set if the connector is "hotplug" capable, and finally a flag that is TRUE if muliple connections to this connector is allowed.

#### instantiated

Optional attribute; read/write access; type: b.

Set to TRUE if the component has been instantiated.

#### object\_list

Optional attribute; read/write access; type: D.

Dictionary with objects that the component consists of.

#### object\_prefix

Optional attribute; read/write access; type: String.

Object prefix string used by the component. The prefix is typically set by the **set-component-prefix** command before the component is created.

#### top\_component

Optional attribute; read/write access; type: Object.

The top level component. Attribute is not valid until the component has been instantiated.

#### top level

**Optional** attribute; **read/write** access; type: **b**.

Set to TRUE for top-level components, i.e. the root of a hierarchy.

#### 4.5.2 top-component

#### Description

Base top-level component class, should not be instantiated.

#### **Attributes**

#### components

**Optional** attribute; **read/write** access; type: [**o**\*].

List of components below the top-level component. This attribute is not valid until the object has been instantiated.

#### cpu\_list

**Optional** attribute; **read/write** access; type: [**o**\*].

List of all processors below the top-level component. This attribute is not valid until the object has been instantiated.

## **Chapter 5**

## **Miscellaneous Notes**

#### 5.1 Notes on Solaris for Fiesta

- For information about system administration of Solaris, see the http://docs.sun.com web site.
- Remember to boot with the -r flag after changing a machine configuration. Example:

```
simics> system_cmp0.set-prom-env boot-command "boot disk1 -rv"
```

- Booting from a disk in a different location that it was setup for is not recommended. It is possible, but requires some knowledge of Solaris administration.
- When using multiple Ethernet adapters in a Serengeti system, all will be assigned the same system-wide MAC address by Solaris. To avoid this, the OBP variable <code>local-mac-address</code>? can be set to <code>true</code>. Setting this variable from the Simics command-line is done using the following command:

```
simics> system_cmp0.set-prom-env local-mac-address? true
```

## 5.2 Multiple Network Devices

By default, only the first network device is connected to a simulated network when running with <code>\$create\_network</code> set to <code>yes</code>. To run with multiple network devices, the <code><device>.connect</code> command should be used to connect each additional device to the Ethernet link. If several network devices have the same MAC address (default unless the <code>local-mac-address</code>? OBP variable is set) they must be connected to different simulated links.

## 5.3 Changing the Processor Clock Frequency

The clock frequency of a simulated processor can be set arbitrarily in Simics. This will not affect the actual speed of simulation, but it will affect the number of instructions that need to be executed for a certain amount of simulated time to pass. If your execution only depends on executing a certain number of instructions, increasing the clock frequency will take the same amount of host time (but a shorter amount of target time). However, if there are time based delays of some kind in the simulation, these will take longer to execute.

At a simulated 1 MHz, one million target instructions will correspond to a simulated second (assuming the simple default timing of one cycle per instruction). At 100 MHz, on the other hand, it will take 100 million target instructions to complete a simulated second. So with a higher clock frequency, less simulated target time is going to pass for a certain period of host execution time.

If Simics is used to emulate an interactive system (especially one with a graphical user interface) it is a good idea to set the clock frequency quite low. Keyboard and mouse inputs events are handled by periodic interrupts in most operating systems, using a higher clock frequency will result in longer delays between invocations of periodic interrupts. Thus, the simulated system will feel slower in its user response, and update the mouse cursor position etc. less frequently. If this is a problem, the best technique for running experiments at a high clock frequency is to first complete the configuration of the machine using a low clock frequency. Save all configuration changes to a disk diff (like when installing operating systems). Then change the configuration to use a higher a clock frequency and reboot the target machine.

Note that for a lightly-loaded machine (for example, working at an interactive prompt on a serial console to an embedded Linux system), Simics will often execute quickly enough at the real target clock frequency that there is no need to artifically lower it.

## **Chapter 6**

# Installing an OS on Simics

## 6.1 Installing Solaris on Simics

Solaris can be installed directly on the simulated machine in Simics. Solaris can be obtained from Sun's web-site at http://www.sun.com/software/solaris/binaries/get.html in the form of ISO images.

To simplify the installation process, some scripts are supplied with the Simics distribution for the chili machine: chili-sol<version>-cd-install.simics, where <version> is 8, 9 or 10. The scripts will answer all questions automatically to create a standard workstation install.

### 6.1.1 Installation, step by step

This section describes how to install Solaris using the command-line version Simics.

- 1. Select the install script to use, depeding on Solaris version to install, either chilisollo-cd-install.simics for Solaris 10, chilisollo-cd-install.simics for Solaris 9, or chilisollo-cd-install.simics for Solaris 8.
- 2. Set the path to the CD images in the simics script. The line

```
con_{path}[\sin x] = ("sol-10-u2-ga-sparc-v" + \sin x + ".iso")
```

should be changed to reflect the location and name of the CD images for the installlation. It can either be ISO image files, or a CD-ROM device file (Linux and Solaris host only).

- 3. Start the first installation script, for example:
  - \$ ./simics targets/fiesta/chili-sol10-cd-install.simics

and wait for it to complete. This may take several hours, depending on the performance of the host machine.

- 4. When the script stops, the installation is ready. The newly created disk image has the following file name: chili-sol<version>-install.disk.
- 5. To boot a machine with the newly installed Solaris OS, run the chili-common. simics and make sure that the variable \$os is set to "solaris10", "solaris9" or "solaris8" depending on the operating system version installed). Add a line like the following first in that simics script:

```
$os = "solaris10"
```

6. An optional last step is to compress the disk image with the craff utility to save some disk space.

## **Chapter 7**

## Limitations

## 7.1 Limitations of the Simulated Model

- The following UltraSPARC registers are not implemented:
  - The ECC error registers.
  - Cache diagnostic registers.
  - Performance control registers, and counters.
- The following on-board devices are not modeled in Simics.
  - Missing from the MD1535D+ South Bridge:
    - \* USB ports.
    - \* AC97 Sound Card.
    - \* Modem.
    - \* Parallel port.
  - Smart card reader.
- Most legacy devices in the MD1535D+ South Bridge have hard-coded addresses in Simics that can not be reconfigured by target software.
- Several registers in the MD1535D+ south-bridge are not yet implemented.
- Changing the processor frequency is not yet supported.

#### 7.2 Other Limitations

• The Solaris version of SimicsFS does not support truncating files.
